

Camera Polarizer Lens

A Camera Polarizer Lens is a filter and a relatively common photography tool. Camera polarizer is usually placed in front of the camera to assist shooting and create special effects by changing or controlling light. Camera polarizer control the amount of light that bounces off a subject at an angle, preventing unwanted light from entering the lens, resulting in images with higher contrast and color saturation.

85mm F1.8 Medium Telephoto Portraits lens for DSLR camera

Camera Polarizer Lens Description

The 85mm 1.8 is the standard for portraiture lenses.

Its distinctive focal length and large aperture give it great movement between uses, from portraits to everyday images.

The 85mm 1.8 is also equipped with a multitude of technology to further ensure unmatched image quality.

A smooth manual focusing ring ensures quiet, accurate focusing, full metal body, Super Multi-Layer Coating to reduce flare and ghosting, and a rear focusing system to minimize fluctuation of aberration caused by focusing.

Truly designed to optimize available light, it has a removable lens hoods to block out extraneous light and glass coating for better results from backlighting scenarios.

- 1: HD, super multicoated optics for the sharper images
- 2: All metal solid construction
- 3: Natural angle of view and perspective is ideal for portraits and natural images
- 4: Designed to produce beautiful background blur
